

## Grease and Oil Separator Ladle Patent Application

### ABSTRACT

The Grease and Oil Separator Ladle is a special deep-bowled long-handled grease and oil separator kitchen tool. The purpose of this kind of ladle is to remove of the excess fat or cooking oil from the top of soup, or other kind of liquid, by having a built in perforated dome in the middle of its concave part. The dome collects the fat or cooking oil and releases into the collection part of ladle thorough the holes located on the dome. It should be used only for warm liquid having grease or oil swimming on the top, like warm soup.
